When appliance demand is expressed in gallons of propane per minute (GPM), a propane vaporizer will likely be needed. Propane vaporizers operate by using liquid propane to produce vapor (propane gas) for downstream equipment. Vaporizers serve to meet the demands of equipment because the environmental conditions present challenges to container vaporization capacity, such as in cold temperatures or because LP Gas appliance vapor requirements are extremely high. Vaporizers can't be installed without changing the propane withdrawal method of the propane tank. This is crucial to understand because propane tanks supply vaporizers with liquid and therefore, the temporary installation and use of a vaporizer isn't always practical or efficient.

WHO NEEDS THE TRAINING? This training is designed to help field technicians and managers understand good practices and procedures associated with the safe operation of a vaporizer. Any employee that uses vaporizers must understand the sizing and installation requirement. They must also understand piping and regulator system design and trouble shooting skills needed to ensure peak performance of the system.

WHAT DOES THE TRAINING INCLUDE? (1) Basic information on safety using and maintaining direct and indirect fired units, (2) How to respond to emergencies and get them back online, (3) Live fire test and troubleshooting of unit. The training includes printed materials, as well as hands-on training.
